

GeoDim 1 Universaldimmer

Operating Manual

GeoDim 1 Universaldimmer

GeoDim dimmers have been developed for the use at events, tv studio, industry, catering trade, cinema and conference room.

Installation and setup has to be done by a technician. Please read this manual carefully before starting the installation, to secure the optimized function of your dimmer.

If there appear at any time any malfunctions or mechanical defects at the dimmer or the electrical wiring, please disconnect the dimmer immediately from the mains power and get in contact with the technical service.

The dimmer can be used for mobile applications or hanged in trusses or mounted onto a wall. The opening of the dimmer is NOT required. At mobile use over dance floors, stages or any other public areas the dimmer has to be protected against falling down with a safety line.

To prevent over heating at continuous use, the dimmer may be used only at free air circulation - not covered.

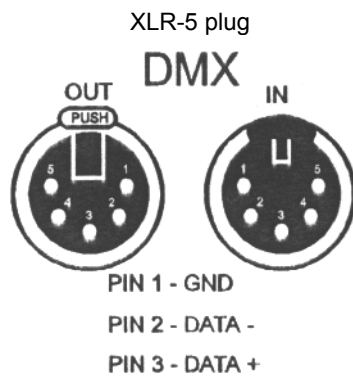

Operation only in dry areas.

The dimmer contains parts under dangerous voltage. At opening the dimmer or when the housing is broken, there is danger for your life.

TECHNICAL DATAS

Power supply:	1 phase 220 – 230 volts, 50 - 60Hz. max. 10 amps. (depends of the connected load) The supply line must be protected by a fuse /breaker with. max. 16 amps.
Maximum power consumption:	2,3 kwatts
Input :	DMX 512 / 1990 Analog 0 ... +10 volts dc Potentiometer control
Output :	1 load channel for max. 2300 watts load. inductive load (mech. transformers max. 2000 watts) resistive load (incandescent or quartz lamps max. 2300 watts)
Minimum load:	60 watts (optionally available with 10 watts)
Housing:	Metal housing for use in dry rooms. (IP 30)
Protection:	load: magn. breaker 16 amps /C 250V electronic: fuse 0,2 amp slow blow 250V
Ambient temperature:	0 deg. C° ... 35 deg. C° (higher ambient temperatures are possible at lower output loads / derating. Please inquire)
Dimensions:	W 120 mm x h 70 mm x depth 200 mm
Weight:	1,3 kg / 1,5 kg

Subject to be changed.

Inputs:**DMX:**

Pin 1 = Electronic ground
Pin 2 = Data -
Pin 3 = Data +
Housing = Ground (shielding)

Analog:

Pin 1 = -
Pin 5 = + 10 volts

These inputs are only for control voltages. At higher voltages over 10 volts the dimmer will be damaged.

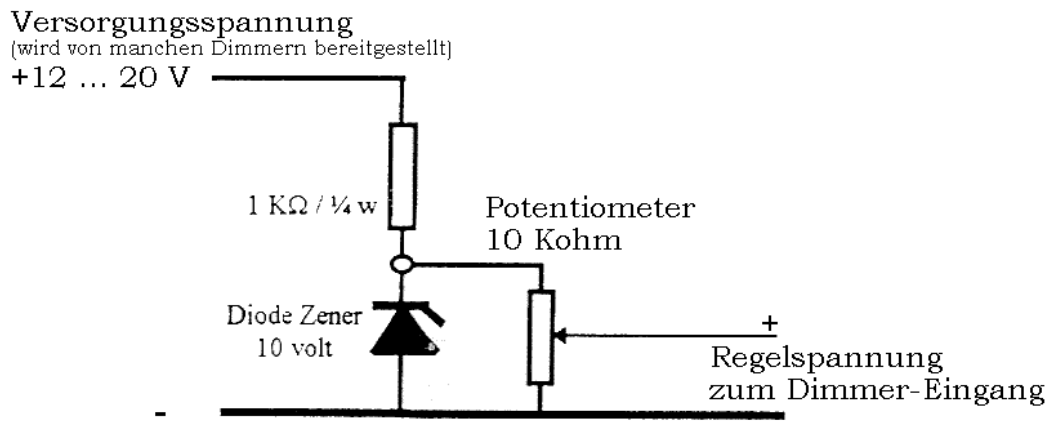

DMX Input:

The dimmer can be controlled by standard DMX-512 protocol (control console). Connect the DMX input as above and select the required DMX address. Now the control of the dimming intensity works via the DMX signal.

0 -10V Analog Input:

It is possible to control the dimmer by an external 0 ... 10 volts dc voltage. Connect the analog input (XLR pin 1 and 5) as shown above. Now the dimming intensity corresponds to the analog voltage changings. 5 volts will result 50% lamp brightness, 10 volts give 100%

Example how to connect a potentiometer:

**[Optionally 1-10V Analog Input / EIB installation bus operation]**

To drive the GeoDim 1 over an EIB actor, the dimmer input can be configured as current sink. Pin 4 and 5 of the XLR connector have to be bridged. Now the 10 volts control voltage is supplied to the input connector.

Actor connection:

Pin 1 – to the negative actor output
Pin 5 – to the positive actor output

This operation mode is only available on request.

If the dimmer works in this mode, but no actor connected, then it will give 100% light intensity. (As common at dimmable electronic fluorescent ballasts)

How to start the dimmer:

If the power cord of the GeoDim is plugged into a Schuko socket (230 volts), it is ready for use.

Initialisation on the display. (**GeoDim – 1**)

After 5 sec. the display is automatically switched into the menu mode.

Menu Mode:

In the standard operation mode the display shows the valid DMX address. With the Up /Down buttons you can select different menu points.

Menu Points (Main Menu):

DMX Address (0-501)

Display Level Unit (dimming level in 0-100% or in 0-255 bit)

Setup – Access to sub menu points.

Menu Mode - Submenu – DMX Address

The digit „A“ means „DMX address“, and the following digits show the selected DMX address value.

If there is a small dot blinking on the right of the display, the GeoDim is receiving a DMX signal. If there is no blinking dot, no DMX is received.

DMX Address Adjustment:

Press the enter key and the first digit will blink. With the Up /Down keys you can select any address between 1 and 512.

Press the Enter key to save your selection. To exit this adjustment mode without any changing, please use the ESC function (press Up and Down at the same time).

Menu Mode – Submenu - Intensity Level

Here is shown the actual intensity value. The digits 2 to 4 show the dimming level in 0 - 100%.

Press the ENTER key and the ‚U‘ will blink. Now you can change the dimming level with the UP / DOWN keys or with the Data fader.

Press the Enter key to save your adjustment. To exit this adjustment mode without any changing, please use the ESC function (press Up and Down at the same time).

Menu Mode – Submenu - Setup**SEtU**

Press „ENTER“, to enter the setup mode.
There you can adjust and modify many parameters.

Setup Menu Points:**Mode**

Dimming Mode Adjustment (off, on, switch, time, linear, logarithm).
The regulation curve (relation between input signal and dimming output) can be changed.

PreH

Preheat Level (Minimum output level) (0-39%)

Hi. GH

Max. output value (49-100%)

To limit the output voltage. For special lighting applications or to enlarge life time of lamps or to be able to use 110 volts light bulbs without any transformer.

Attention – At use with 110 volts bulbs, there is the maximum output power of 1000 Watt allowed.

rEvE

Inverts max. and min. brightness at DMX use (high DMX level will result a low brightness, a low DMX level will give a high light output)

0 10.V

Activates 0-10V analog inputs

d. SP

Display contrast (10-100%)

rAnG

Display Range (Dimming output value is displayed in 0 -100 % or in 0 - 255 bit)

t. nE

Operating hours (0 - 9999 h)

rESE

Reset, recalls manufacturers parameters.

Ver.2

Shows software version number.

Setup Menu Mode – Preheat**PrEH**

To fix an absolute minimum level. The dimmer cannot give out a lower level, than the selected preheat level (minimum value).
Press ENTER to access this menu point.

27

This is the active minimum level. The value is displayed in 0-100%.

Press ENTER to change this value. The display starts blinking. With the Up / Down keys you can change this value between 0% and 39%.

Press the Enter key to save your adjustment. To exit this adjustment mode without any changing, please use the ESC function (press Up and Down at the same time).

Setup Menu Mode – High (Max Level)**H. 0H**

To fix an absolute maximum level. Here you are able to limit the dimming output at a maximum level. Press ENTER to access this menu point.

87

This is the active max. level. The value is shown in 0 – 100%.

Use the UP DOWN keys to change this level between 50% and 100% .

The digits are blinking.

Press the Enter key to save your selection. To exit this adjustment mode without any changing, please use the ESC function (press Up and Down at the same time).

Setup Menu Mode – Reverse DMX**rEUE**

Here you can invert the received DMX signal level.

Press the ENTER key to see the active value on the display: 'on' or 'off'.

on

'on' means reverse active. A high DMX level will result a low dimming level

With decreasing the DMX level, the dimming output will increase.

Press the UP or DOWN key, to deactivate this function.

off

'off' means DMX standard.

Press UP or DOWN, to change this setting.

Press the Enter key to save your selection. To exit this adjustment mode without any changing, please use the ESC function (press Up and Down at the same time).

Setup Menu Mode – Mode

Mode

Here you can assign one of five dimming curves to the dimmer
Press ENTER to access this menu point.

On

'On' means:

The channel is always on.
It cannot be controlled and gives continuously 100% on the output.

Swit

'Swit' - Switch Mode:

(The dimmer can only switch on or off, like a relay.) Recommended to control mh lamps or other not-dimmable fixtures or motors, like projection screens, stage curtains, jalousies etc.

time

'time':

The dimming curve is like an „S“. Recommended for TV studio / movie.

Line

'linear'

Relation of input level and dimming output is linear. The standard mode.

LogA

'logarithm'

Relation of input level and dimming output is logarithmic. Recommended to dim fluorescent lamps.

Press the Enter key to save your selection. To exit this adjustment mode without any changing, please use the ESC function (press Up and Down at the same time).

Setup Menu Mode – 0-10V Input activation

A rectangular LED display showing the text '0 10.0' in a digital font.

Here the 0-10V analog input can be activated.
Press ENTER to see the active adjustment.

A rectangular LED display showing the text 'off' in a digital font.

'off' means: The analog input is deactivated.
Press the UP or DOWN key to activate the input.

A rectangular LED display showing the text 'on' in a digital font.

'on' means: The analog input is activated. The GeoDim can be controlled over this input.
Press the UP or DOWN key to deactivate this input.

We suggest to deactivate the analog input, if it is not used. So the dimmer is protected against any signal disturbance.

Setup Menu Mode – Display

A rectangular LED display showing the text 'd. 50' in a digital font.

Here you can adjust the display brightness.
Press ENTER to see the active level adjustment.

A rectangular LED display showing the text '100' in a digital font.

With the UP / DOWN keys you can adjust the brightness between 10% and 100%.

Press the Enter key to save your setting. To exit this adjustment mode without any changing, please use the ESC function (press Up and Down at the same time).

Setup Menu Mode – Range

r R n C

Here you can select the units in which the dimming level is shown on the display (% or bit).

Press ENTER to see the actual selection.

100

The active range is „%“ - the output level is displayed in 0 - 100% .

Press UP or DOWN to change this range.

255

The active range is „bit“. The dimming level is shown in 0 – 255 bit.

Press UP or DOWN to change this range.

Press the Enter key to save your selection. To exit this adjustment mode without any changing, please use the ESC function (press Up and Down at the same time).

Setup Menu Mode – Time – Operating Hours

t n E

Shows, how long the dimmer has been used.
Interesting for rental or for maintenance periods.

This adjustment cannot be resetted.

0027.

The blinking point shows the seconds.

Press ENTER to exit this mode.

Setup Menu Mode – Reset

r E S E

Here you can reset all parameters to the factory parameters.

Attention - all your previous settings and lighting scenes will be erased !

Press ENTER to activate this mode - the display starts blinking.

Now press and hold the UP and DOWN keys at the same time 5 seconds. Press until the blinking will stop. Now the factory settings are recalled and the memories are empty.

Setup Menu Mode – Software Version

U E r . 2

The last digit shows the actual software version number.

Manufactured in EU by:
